

PRE-CONSTRUCTION CONDITION SURVEYS

GME was founded in 1981 to assist our clients in property development through geotechnical, construction testing and environmental services.

Our Special Projects department performs Pre-Construction Condition Surveys (PCCS) prior to the start of blasting, pile-driving, structure and pavement demolition, and vibration producing activities. The PCCS includes video and still photographs of the exterior and interior of structures, and seismographic measurements of vibrations on and around the site. The PCCS provides a visual and written documentation of surrounding structures for our clients before work is started.

How far do pile driving vibrations travel?

Self-recording Seismograph

Videotaping an Existing Structure

Avongard Monitor to Measure Crack Movement
