

WIRELESS TEMPERATURE & HUMIDITY MONITORING

By combining the expertise of our Special Projects (Forensic Testing) group and our environmental air quality group, we provide our clients with unique services in monitoring for temperature and moisture in inaccessible or enclosed portions of buildings. We also provide air/water infiltration testing to explore for sources of water entry. The drawing and photographs below illustrate potential locations of our unobtrusive wireless temperature and humidity sensors. Please contact us to discuss any of your projects where this type of study is required.

The remote units have FM broadcasting to send information to a central receiver hooked up to a computer for continuous recording
